

VHISTEXP.EXE (Virus History Exporter) will go through all of your Norton AntiVirus Corporate Edition logs and export, in a comma delimited file (*.CSV file), all of the Virus Found events from those logs. VHISTEXP can be run in any directory, and the result will automatically be created and placed in the same directory that VHISTEXP was run. The output file will be named "VirusHist.csv". If the file already exists in the directory, it will overwrite it. If the log files on your machine do not contain any Virus History information, "VirusHist.csv" will still be generated, but will be an empty file.

VHISTEXP works on both Norton AntiVirus Corporate Edition Servers and Norton AntiVirus Corporate Edition Clients. VHISTEXP works on all versions of NavCorp 7.0 and later.

In order to narrow your search, you can include one command-line argument. The command-line argument is simply search criteria that VHISTEXP will follow. Without a command-line argument, VHISTEXP will search through every NavCorp log file you have on your machine at the time. The names of the log files that NavCorp generates are very straightforward. They are simply the month, day, and year the log was generated. So for example, a log generated on September 6th, in the year 2001 will have the name "09062001.log". Knowing this, you can narrow your searches to, for example, export only Virus Found Events from the month of July in the year 2001. To do this, simply add a command-line argument that reads "07*2001.log". Or if you only want to search of Virus Found Events that have occurred in the year 2000 only, add the command-line argument "*2000.log". Just be sure to include the ".log" at the end of your command line argument.
